The present sequence encodes a Candida (1989) 10aDR527, 20aDR527, CaPLO24, CaNL260, and CaDR361. These genes are essential for survival, and so are good targets for antifungal agents. The Candida albicans genes and their derived proteins are used to screen compounds for the ability to inhibit the activity of the protein, i.e. for antifungal activity. The proteins are also used to generate a protein antibuday response against fungal infections in mammals. The Candida albicans proteins and their antibodies, are used for diagnosing fungal infections, specifically C. albicans (in standard amplification, hybridisation or immunological assays, and for studying

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          360
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             300
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              420
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               9
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     9
                                                   The present invention relates to novel methods for constructing fungal strains useful for identification and validation of gene products as targets for therapeutic agents, for creating a collection of identified essential genes, and screening assays for the discovery of new drugs. The invention provides the GRACE (gene replacement and conditional expression) method for the construction of mutent organisms. Eferred to as GRACE strains of the organism. The invention can be applied to any organism, particularly a pathogenic fungus e.g. Candida albicans, aspergillus fungatus and Cryptococcus neoformans. The methods are useful to identify agents that may be used in the treatment of fungal infections. AAS23381-AAS2342 represent C. albicans essential genes.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          241 TIGGAAATATITITGGCACAAATTICTATAACGAATGGAGATAAAGAAGTITGTATAT

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                g
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ò
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The invention relates to constructing (M1) a strain of diploid fungal cells in which both alleles of a gene are modified, comprising modifying one allele by insertion or replacement by a cassette having an expressible selectable marker and modifying other allele by insertion or replacement by a cassette having an expression of the second allele by the terologous promoter. (M1) is useful for constructing a strain of diploid fungal cells in which both alleles modified are useful for identifying a gene the cells having both alleles modified are useful for identifying a gene that cells having both alleles modified are useful for identifying a gene that contributes to the virulence and/or pathogenicity of a fungus, a gene that contributes to the virulence and/or pathogenicity of a fungus to an antifungal agent that inhibits the growth of a diploid fungus contributes to the resistance of a diploid fungus to an antifungal agent that inhibits the growth of a diploid fungus cand for identifying a therapeutic agent for treatment of a mammalian disease. (M1) is useful for identifying a compound which modilates the compound catabolism, biosynthetic, transporter, transcriptional, compound catabolism, biosynthetic, transporter, transcriptional, cativity of inhibit growth or proliferation of C. albicans cells and for treatment in infection by C. albicans. The present sequence is that of an essential candida albicans gene used in the method of the invention. The specification describes genes CaDRA472, CaDR489, 1CaDR527, CaPL024, CaNL260, and CaDR361. These genes are essential for survival, and so are good targets for antifungal agents. The Candida albicans genes and their derived proteins are used to screen

compounds for the ability to inhibit the activity of the protein, i.e. for antifungal activity. The proteins are also used to generate a protective antibody response against fungal infections in mammals. The Candida albicans proteins and genes, and their antibodies, are used for diagnosing fungal infections, specifically C. albicans (in standard amplification, hybridisation or immunological assays, and for studying pathogenic fungi.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      New mosquito olfaction polypeptides and polynucleotides, useful for mosquito management, i.e. controlling the pest and disease vectors, or for identifying pest control agents

The present invention describes a purified Anopheles gambiae olfaction polypeptide comprising a 383, 394, 380, 411, 412, 391, 157 or 401 residue amino acid sequence (see ABP52831 to ABP52840) ($11), a conservatively modified amino acid sequence of them, or a sequence of ($11) with at less to comprising; (a) a nucleotide sequence encoding the purified Anopheles gambiae olfaction polypeptide; or (b) a nucleotide sequence that of phyridises under stringent conditions to a hybridisation probe comprising (a) spiritied Anopheles of hybridises under stringent conditions to a hybridisation probe comprising a 1964, 1129, 1142, 1136, 1194, 1176, 474 or 1206 nucleotide sequence (see ABQ75102 to ABQ75102 and ABQ75110 to ABQ75113) ($2), or its complement; and ($2) a method for identifying an agent that binds to mosquito olfaction molecules comprising; (a) providing an isolated mosquito olfaction molecule; (b) contacting a test agent with the isolated mosquito olfaction molecule; and (c) detecting specific binding comprising the test agent to the isolated mosquito olfaction in molecules are useful for mosquito olfaction binding identifies the test agent as a mosquito of the test agent to the isolated mosquito olfaction molecules are useful
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              2678
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           2731
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             2618
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            2791
                                                                                                                                                                                                                                                                                                                                                                                                            for mosquito management, i.e. controlling this pest and disease vector. A method from the present invention of screening for substances that modulate arrestin-dourant receptor interaction is useful for identifying pest control agents. The present sequence represents Anopheles gambiae dourant receptor 2 genomic DNA from the present invention.

N.B. The features given in figure 4a are tentative and do not directly encode SEQ ID NO:6 (ABP52035)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             363

Constructing strains for identifying gene products as effective targets for therapeutic intervention, by inactivating in the strain one allele of a gene and placing other allele of the gene under conditional Ohlsen KL; Виввеу Н, Boone C,

Claim 76; SEQ ID NO 2884; 167pp + Sequence Listing; English.

The invention relates to constructing (M1) a strain of diploid fungal cells in which both alleles of a gene are modified, comprising modifying cells in which both alleles of a gene are modified, comprising modifying cons allele by insertion or replacement by a cassette having an expressible selectable marker and modifying other allele by the promoter. (M1) is useful for constructing a strain of diploid fungal cells in which both alleles of a gene are modified. The diploid fungal cells in which both alleles of a gene are modified. The diploid fungal cells in which both alleles of a gene are weeful for identifying a gene that contributes to the survival or growth of a fungus, a gene that contributes to the resistance of a diploid fungus to an antifungal agent that inhibits the growth of a diploid fungus of the contributes to the resistance of a diploid fungus to an antifungal agent that inhibits the growth of a diploid fungus of and for identifying a compound which modulates the compound catabolism, blosynthetic, transporter, transcriptional.

Compound catabolism, blosynthetic, transporter, transcriptional, translational signal transduction, DNA replacation and cell division activity. The method is useful for identifying a compound having the compound subtraction by C. albicans. The present sequence is that of a pcr reating infection by C. albicans. The present sequence is that of a pcr reating infection by C. albicans. The present sequence is that of a pcr reating in the printed and convert Note: The sequence data for this patent is not represented in the printed specification but is based on sequence information supplied to Derwent by the European Patent Office.

(EPIG-) EPIGENOMICS AG

Berlin K; Piepenbrock C, olek A,

WPI; 2001-602751/68

Designing primers and probes for analysing diseases associated with cytosine methylation state e.g. arthritis, cancer, aging, arteriosclerosis comprising fragments of chemically modified genes associated with cell cycle

Claim 1; SEQ ID No 51; 28pp; English.

molecules associated with the cell cycle and specific PCR primers of the invention. The sequences are useful for detecting the methylation state of all CPG dimucleotides in a sequence and therefore for analysing sociated diseases. By analysing cycosine methylations in the pretreated both, generatic and/or epigenetic parameters for the diagnosis and therapy of existing diseases or the predisposition to specific diseases can be ascertained. The parameters may be compared to another set of genetic diagnosis and/or apigenetic parameters, the differences serving as basis for diagnosis and/or prognosis events which are disadvantageous to patients. The sequences of the invention are useful for the diagnosis and therapy aging, plomerular disease, leavy body disease, graft-versus-host disease, arteriosclerosis, solid tumours and cancers. Sequences AAS45296-AAS45520 represent chemically pretreated genomic

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The invention relates to a nucleic acid, which comprises a segment of the chemically pretreated DNA of genes associated with DNA transcription from one of 346 sequences, and an oligomer; in particular an oligomuclectide or peptide nucleic acid (PNA) -oligomer that hybridises to or is identical transcription. The set of aligomer probes are useful for detecting the cytosine methylation state and/or single nuclectide polymorphisms (SNPs) in a chemically pretreated genomic DNA. The nucleic acids are useful for

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                246
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  186
                                                                                                                                                 The present invention describes the human hypocretin (orexin) receptor 2 (HCRRE) gene (given in AAH31613), which is associated with narcolepsy. Identification of the HCRTR2 nucleic acid molecule permits the diagnosis of narcolepsy. A method from the present invention is provided for treating narcolepsy by administering to the individual an isolated HCRTR2 nucleic acid in a therapeutically effective amount so that the cells produce native HCRTR2 receptor. The diagnosis of narcolepsy has been difficult to differentiate from other conditions such as chronic facting acid makes it possible to accurately diagnose narcolepsy.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             306

The present invention provides a number of human immune system associated genes which are modified by the methylation of cytosines. The sequences can be used in the diagnosis and treatment of immune system discorders, including eye diseases such as retinopathy, neovascular glaucoma and macular degeneration, arteriosclerosis, anaemia, cancer, acute myeloid leukaemia, Alzheimer's disease, AnDS, epilepsy, neurofibromatosis, rheumatoid arthritis, psoriasis and inflammatory/ulcerative bowel diseases. The present sequence is a gene of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      4116
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              4115 CAATATTAAAATATAAAACTACATAATAAAAATAATAATTAATTAATTAAATAAAA 4056

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The invention relates to 224 nucleic acid sequences comprising at least 18 bases of a chemically pretreated gene associated with gene regulation selected from 43 known genes (or complementary sequences). The chemical pretreatment converts cytosine bases unmethylated at the 5-position to uracil or another base with hybridisation behaviour
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     New nucleic acid sequences from chemically modified genes associated with gene regulation, useful for analysing cytosine methylations for diagnosis and therapy of diseases e.g. severe combined immunodeficiency

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The present invention provides a number of human immune system associated genes which are modified by the methylation of cytosines. The sequences can be used in the disponsis and treatment of immune system disponders, including eye diseases such as retinopathy, necvascular glaucoma and macular degeneration, arteriosclerosis, anaemia, cancer, acute myeloid leukaemia, Alzheimer's disease, Alzheijepsy, neurofibromatosis, rheumatoid arthritis, psoriasis and inflammatory/ulcerative bowel diseases. The present sequence is a gene of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   66 AGAAGGTCAAATACAAGGACAAAAGATCAATATTTAGAAGGAAAAGAATATGGTTATCA 125

dissimilar to cytosine, to enable analysis of cytosine methylations.
The DNA sequences, oligomers (or sets/arrays) and method are useful in the disquosis of diseases for predisposition to diseases) associated with gene regulation and in therapy of such diseases, by this are provided. They are especially useful in disquosis and therapy of e.g. severe combined immunodeficiency disease, cardiac and therapy of e.g. severe combined immunodeficiency disease, cardiac disorders, haemophilia, solid tumours and cancer, werner syndrome, asthma, this syndrome, Saethre-Chorzen syndrome, renal disease, sequence included in the sequence data for this specification and is associated with the human gene regulation-associated genes.

Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at.

```
A polypeptide comprising a Plasmodium falciparum (Pf) erythrocyte membrane protein 1 (PfEMPI) or active fragments or analogues of that protein can be used in the treatment or prevention of symptoms of a malaxia parasite infection. The polypeptides can inhibit, block or reverse the sequestration of erythrocytes in patients suffering from malaxia. Nucleic acids derived from the PfEMPI gene can be used as probes and primers to identify a Plasmodium falciparum parasite, the primers used to generate characteristic amplification patterns from different P. falciparum strains. Antibodies specifically immunoreactive with the PEMPI polypeptide or its fragments may be used in diagnosis of malaria infection. This sequence encodes the

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       6566
                                                                                                                                                             The present invention provides a number of human immune system associated genes which are modified by the methylation of cytosines. The sequences can be used in the diagnosis and treatment of immune system disorders, including eye diseases such as retinopathy, neovascular glaucoma and macular degeneration, arteriosclerosis, anaemia, cancer, acute myeloid leukaemia, Alzheimer's disease, ANDS, epilepsy, neurofibromatosis, rheumatoid arthritis, psoriasis and inflammatory/ulcerative bowel diseases. The present sequence is a gene of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           125
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            245

The invention relates to a purified nucleic acid molecule associated with lactation or muscle and fat deposition (designated LMFD), derived actation and the LMFD nucleic acid can specifically hybridise to a second nucleic acid molecule comprising any of 15112 nucleotide sequences, appearing as ABX34836-ABX49947, or complements of them.

Comprising an LMFD nucleic acid linked to a promoter and 3' non-cranisated sequence that functions in the cell to cause termination of transcription and addition of polyadanylated inbouncedides to a 3' end comprising an LMFD nucleic acid linked to a promoter and 3' non-cranscription and addition of polyadanylated inbourderides to a 3' end complement or and addition of polyadanylated inbourderides to a 3' end complement or fragment with a complementary nucleic acid (comprising any of the 1512 nucleic acid molecule for complement or fragment where hybridisation between the complementary nucleic acid and the complementary nucleic acid and the complementary nucleic acid and the complementary nucleic acid is predictive of the level or pattern of the LMFD nucleic acid is predictive of the level or pattern of the LMFD nucleic acid is bovine cell or tissue. It is useful for genome of a molecule in a bovine cell or tissue. It is useful for genome complementary nucleic acid is bread for determining a level or pattern of a molecule in a bovine cell or tissue. It is useful for genome complementary nucleic acid is useful present sequence is one of the 15112 bovine complement sequence tag) nucleic acids.

This GSS is part of a random genomic sequencing program of thirteen
yeast species: Saccharomyces bayanus var. uvarum, Saccharomyces
exiguus, Saccharomyces bayanus var. uvarum, Saccharomyces
lactis var. lactis, Kluyveromyces thermocolerans, Kluyveromyces
lactis var. lactis, Kluyveromyces marxianus var. marxianus, Pichia
angusta, Debaryomyces hansenii var. hansenii, Pichia sorbitophila,
Candida tropicalis and Yarrowia lipolytica. Genomic inserts of 3 to
5 kb were prepared and both extremities were sequenced. See

- Determination of this BAC-end sequence was carried out as part of a collaboration with the Berkeley Drosophila Genome Project (BDGP).

The BDGP is constructing a physical map of the Drosophila melanogaster genome using these BACs. For further information please see http://www.fruitfly.org The BDGP Drosophila melanogaster BAC library was prepared by Kazutovo Googgawa and Aaron Mammoser in Pieter de Jong's laboratory in the Department of Cancer Genetics at the Roswell Park Cancer Institute in Buffalo, NY. The library is named RepCT-98 and was constructed by partial ECORI digestion of Drosophila DNA provided by the BDGP from the isogenic strain y2; cn bw sp, the same strain used for the BDGP's Pl and EST library is named RepCT-98 and was constructed by partial and how to order individual BAC clones, the entire library or found at http://bacpac.med.buffalo.edu/drosophila_bac.htm.

Determination of this BAC-end sequence was carried out as part of a collaboration with the European Drosophila Genome Project (EDGP) - http://www.edgp.ebi.ac.uk -. This Drosophila melanogaster BAC library (Dros BAC) was made by Alain Billaud at CEPH (Centre Droject grant. The DNA was prepared from embryos by Alain Bucheton project grant. The DNA was prepared from embryos by Alain Bucheton and Genevieve Payan. It has been constructed in the vector

- Determination of this BAC-end sequence was carried out as part of a collaboration with the Berkeley Drosophila Genome Project (BDGP). The BDGP is constructing a physical map of the Drosophila melanogaster genome using these BACs. For further information please see http://www.fruitfly.org The BDGP Drosophila melanogaster BAC library was prepared by Kazutoyo Osocgaw and Aaron Mammoser in Pieter de Jong's laboratory in the Department of Cancer Genetics at the Roswell Park Cancer Institute in Buffalo, NY. The library is named RECI-98 and was constructed by partial BCORI digetion of Drosophila DNA provided by the BDGP from the isogenic strain y2; cn bw sp, the same strain used for the BDGP's pl and EST libraries. A more detailed description of the library and how to order individual BAC clones, the entire library, or filters for hybridization from the BACPAC Resource Center can be located that the part of the library is comed at http://bacpac.med.buffalo.edu/drosophila_bac.htm.

LUVI DP DNA linear GSS 26-JUL-1999 Brosophila melanogaster genome survey sequence SP6 end of BAC BACN13C23 of DrosBAC library from Drosophila melanogaster (fruit ALI), genomic survey sequence.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Web : www.genoscope.cns.fr)
Determination of this BAC-end sequence was carried out as part of a collaboration with the Buropean Drosophila Genome Project (BDGP) - http://www.edgp.ebi.ac.uk -. This Drosophila melanogaster BAC d'Etude du Polymorphisme Humain) with funding provided by a MRC project grant. The DNA was prepared from embryos by Alain Bullend at CEPH (Centre project grant. The DNA was prepared from embryos by Alain Bucheton and Genevieve Payan. It has been constructed in the vector
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             185

This GSS is part of a random genomic sequencing program of thirteen yeast species: Saccharomyces bayanus var. uvarum, Saccharomyces servazii, Sygosaccharomyces roundii,
Saccharomyces servazii, Sygosaccharomyces roundii,
Saccharomyces kluyveri, Kluyveromyces thermotolerans, Kluyveromyces lactis var. lactis, Kluyveromyces marxianus var. marxianus, Pichia angusta, Debaryomyces hansenii var. hansenii, Pichia sorbitophila, Candida tropicalis and Yarrowia lipolytica. Genomic inserts of 3 to 5 kb were prepared and both extremities were sequenced. See kb were prepared and both extremities were sequenced.

Libratical (107-SEP-2000) Genoscope - Centre National de Sequencage, Submitted (107-SEP-2000) Genoscope - Centre National de Sequencage, 2 rue Gaston Cremieux, CP 5706, 91057 EVRY cedex, FRANCE. (E-mail: sequescagenoscope.cns.fr. www.genoscope.cns.fr]
This GSS is part of a random genomic sequencing program of thirteen yeast species: Saccharomyces bayanus var. uvartum, Saccharomyces ervazzii, Zygosaccharomyces rouxii, Saccharomyces servazzii, Zygosaccharomyces rouxii, Saccharomyces kluyveromyces thermotolerans, Kluyveromyces lactis var. lactis, Kluyveromyces marxianus var. marxianus, Pichia angusta, Debaryomyces hansenii, var. hansenii, Pichia sorbitophila, Candida tropicalis and Yarrowia lipolytica. Genomic inserts of 3 to 5 kb were prepared and both extremities were sequenced. See keywords for description of this sequence and for the sequence of the other extremity of this insert.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         CNSOGVIL 902 bp DNA linear GSS 06-JUL-2001 T3 end of clone AXOAA021C12 of library AXOAA from strain CBS 7064 of Pichia farinosa, genomic survey sequence.

This GSS is part of a random genomic sequencing program of thirteen
yeast species: Saccharomyces bayanus var. uvarum, Saccharomyces
                                                                                                                                                                                                                                                                                                                                                                                                                                  exiguus, Saccharomyces servazzii, Zygosaccharomyces rouxii, Saccharomyces kluyveri, Kluyveromyces thermotolerans, Kluyveromyces lactis var. lactis, Kluyveromyces thermotolerans, Kluyveromyces angusta, Debaryomyces hansenii var. hansenii, Pichia sungusta, Debaryomyces hansenii var. hansenii, Pichia subitophila, Candida tropicalis and Yarrowia lipolytica. Genomic inserts of 3 to 5 kb were prepared and both extremities were sequenced. See keywords for description of this sequence and for the sequence of the other extremity of this insert.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         CNSO6PHM 849 bp DNA linear GSS 05-JUL-2001 T7 end of clone AVOAA014E08 of library AVOAA from strain CBS 379 of Saccharomyces exiguus, genomic survey sequence.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     157

(E-mail: sequefégenoscope.cns.fr) - Web. genoscope.cns.fr) This GSS is part of a random genomic sequencing program of thirteen yeast species: Saccharomyces bayanus var. uvarum, Saccharomyces cataromyces rouxii, Saccharomyces servazzii, Zygoaccharomyces rouxii, Saccharomyces servazzii, Zygoaccharomyces rouxii, Saccharomyces kluyvering servazzii, Pichias sacharomyces hansenii ansenii Pichia sangusta, Debaryomyces marxianus var. marxianus, Pichia angusta, Debaryomyces hansenii var. hansenii, Pichia sorbitophila, Candida tropicalis and Yarrowia lipolytica. Genomic inserts of 3 to 5 kb were prepared and both extremities were sequenced. See the other extremity of this sequence and for the sequence of the other extremity of this insert.

/clone lib="BC"
//note="Vector: pBluescript SK+; Site_1: EcoRI (5'-end of cDNA); Site_2: XhoI (3'-end of cDNA); developing carryopsis cDNA); Site_2: XhoI (3'-end of cDNA); developing carryopsis; 3-15 DAP(days after pollination) Due to a cloning artefact caused by the kit, in most cases the EcoRI site cloning. To excise the lisert, restriction sites upstream EcoRI should be used (e.g. BamHI, SalI; PSII). NOTE: Also due to the cloning system used Blue/white selection for recombinats is not 100% reliable."

-I- FUNCTION: THIS PROTEIN IS INVOLVED IN THE REPAIR OF MISMATCHES IN DNA. IT IS REQUIRED FOR DAM-DEPENDENT METHYL-DIRECTED DNA MISMATCH REPAIR. MAY ACT AS A "MOLECULAR MATCHAARRR", A PROTEIN THAT PROMOTES THE FORMATION OF A STABLE COMPLEX BETWENT TWO OR WORE DNA-BINDING PROTEINS IN AN ATP-DEPENDENT MANNER WITHOUT ITSELF BEING PART OF A FINAL EFFECTOR COMPLEX (BY SIMILARITY: SELONGS TO THE DNA MISMATCH REPAIR MUTL/HEXB FAMILY.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           FUNCTION: Involved in DNA double-strand break repair (DSBR). The rad50/mre11 complex possesses single-strand endonuclease activity and ATP-dependent double-strand-specific exonuclease activity. Rad50 provides an ATP-dependent control of mre11 by unwinding and/or repositioning DNA ends into the mre11 active site (By
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Methanococcus jannaschii.

DNA replication. The cohesion during cell cycle and in DNA replication. The component of cohesion complex. The cohesion of sister chromatide after DNA replication. The cohesion of sister chromatide after complex is required for the cohesion of sister chromatide after chromatide rather complex is cleaved and dissociates from complex is cleaved and dissociates from chromatin, allowing sister chromatide to segregate.

Chromatin, allowing sister chromatide to segregate.

CHERNITY: Cohesin complexes are composed of the SMCI and SMCI heterodimer attached via their hinge domain, MCDI/SCCI which link them, and IRRI/SCC3, which interacts with MCDI. The cohesin complex also interacts with SCC2, which is required for its association with chromosome with SCC2, which is required for its association with chromosome arms. At anaphase, the MCDI scattered along chromosome arms. At anaphase, the MCDI subunit of the cohesin complex is cleaved, allowing chromosome separation.

Leading to the dissociation of the complex from chromosomes, allowing chromosome separation.

Leading to the dissociation of the complex from chromosomes, allowing chromosome separation.

CHERNITY THE FLEXIBLE Hinge domain, which separates the large interaction with the corresponding of SMC3, forming a vename tech by different ends of the cleavable MCDI protein, forming a ring structure.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   This SWISS-PROT entry is copyright.               HEAVY CHAIN SUBUNITS (MHC), 2 ALKALI LIGHT CHAIN SUBUNITS (MLC)

SUBCELLULAR LOCATION: TALL SEQUENCE of the wyofibrils.

SUBCELLULAR LOCATION: TALL SEQUENCE IS HIGHLY REPETITIVE, SHOWING CYCLES OF A 28 FESTIDUS REPEAT PATTERN COMPOSED OF 4 HEPTAPEPTIDES, CHARACTERISTIC FOR ALPHA-HELICAL COLLED COLLS.

FTM: TWO CYSTEINE RESIDUES IN THE SI DOMAIN ARE SELECTIVELY ALKYLAYTED AND ARE REQUIRED FOR MYOSIN ATHES SIDOMAIN ARE SELECTIVELY MISCELLANGOUS: EACH MYOSIN HEAVY CHAIN CAN BE SPLIT INTO 1 LIGHT MEROMYOSIN (LAM) AND 1 HEAVY WEROMYOSIN (HAM). IT CAN LATER BE SPLIT FURTHER INTO 2 GLOBULAR SUBFRAGMENTS (SI) AND 1 ROD-SHAPED
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         92 NGDKEVEDYEKNIKKARNKLRVIAS-ITKETWKIDSLDNLVKEVGGTLQVSENPDDM 147

Bacteriol. 185:2330-2337(2003).

-1- CATALYTIC ACTIVITY: ATP + D-fructose 6-phosphate = ADP + D-fructose 1.6-bisphosphate.

-1- PATHWAY: Key control step of glycolysis.

-1- SUBCELLULAR LOCATION: Cytoplasmic (By similarity).

-1- SIMILARITY: Belongs to the phosphofructckinase family.
                                                                                                                                                                                                                                                                                                                                         SPECIES=S.typhimurium, STRAIN=LT2 / SGSC1412 / ATCC 700720, MEDLINE=21534948; PubMed=11677609;

Natl. Acad, Sci. U.S.A. 97:14224-14228(2000).
-!- CATALYTIC ACTIVITY: ATP + L-1ysine + tRNA(Lys) = AMP + diphosphate
-!- L-1ysyl-tRNA(Lys).
-!- SUBCELLULAR LOCATION: Cytoplasmic.
-!- MISCELLANEGUS: Able to charge E.coli tRNA(Lys) in vitro.
-!- SIMILARITY: Belongs to class-I aminoacyl-tRNA synthetase family.
                                                                                                                                                          34; Gaps
